## Trace Elements in Serum Event #1, 2013

Dear Laboratory Director:

Results from the first proficiency test (PT) event for 2013 in the category Trace Elements in Serum have been tabulated and are summarized. Target values for aluminum, copper, selenium and zinc have been established along with acceptable ranges. Results are graded using element-specific criteria as indicated in each narrative section. A laboratory with an unacceptable significant analytical bias relative to the target value will be expected to investigate the source of the error. A confidential three-digit code number assigned by the PT program identifies participant laboratories.

### PT Materials

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of aluminum (Al), copper (Cu), selenium (Se) and zinc (Zn) in serum. Additionally, serum pools were spiked with a suite of trace elements: cobalt (Co), chromium (Cr), lithium (Li), magnesium (Mg), manganese (Mn), thallium (Tl), and vanadium (V). The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and free of pathogens. The Certificate of Analysis provided by SKML is available upon request.

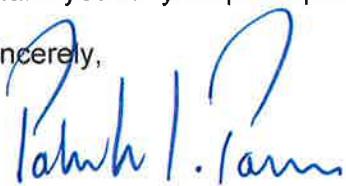

### Serum Selenium

Since switching to the serum materials obtained from the Dutch EQA, we have become aware of a potential interference on Se in ICP-MS when sera from bovine sources are used for PT sample pools. Please refer to the Se narrative for further details.

**The next PT event for trace elements in serum is scheduled to be mailed Wednesday, May 8th, 2013. Please inform our laboratory staff at (518) 474-4484 if the test materials have not arrived within five days of the scheduled mail out date. The deadline for reporting results is Wednesday, June 5th, 2013.**

Thank you for your participation.

Sincerely,

Patrick J. Parsons, Ph.D.  
Chief, Laboratory of Inorganic and Nuclear Chemistry  
Deputy Director, Division of Environmental Health

Mary Frances Verostek, Ph.D.  
Assistant Section Head  
PT Program for Blood Lead /Trace Elements

**New York State Department of Health**  
**Event #1, 2013**

---

**Serum Aluminum**

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of Al, Cu, Se and Zn in serum. Additionally, serum pools were spiked with a suite of trace elements (Co, Cr, Li, Mg, Mn, Ti, and V), including aluminum as  $\text{AlCl}_3$  at various concentrations. The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and free of pathogens. The Certificate of Analysis provided by SKML is available upon request.

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for serum aluminum range from 13  $\mu\text{g/L}$  (0.48  $\mu\text{mol/L}$ ) to 288  $\mu\text{g/L}$  (10.67  $\mu\text{mol/L}$ ).

**Acceptable ranges** for serum aluminum are based on fixed criteria of  $\pm 20\%$ , or  $\pm 5 \mu\text{g/L}$  below 25  $\mu\text{g/L}$ . These criteria are based on consensus recommendations from several EQAS organizers (1).

**Discussion.** Based on the above criteria, 87.0% of test results reported were judged as satisfactory, with four out of 23 participant laboratories (17.4%) reporting 2 or more of the 5 results outside the acceptable ranges.

1. Taylor, A., Angerer, J., Claeys, F., Kristiansen, J., Mazarrasa, O., Mendifto, A., Patriarca, M., Pineau, A., Schoeters, I., Sykes, C., Valkonen, S. and Weykamp, C. Comparison of procedures for evaluating laboratory performance in external quality assessment schemes for lead in blood and aluminum in serum demonstrates the need for common quality specifications. *Clinical Chemistry* 2002 **48** 2000-2007.

**Serum Copper**

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of Al, Cu, Se and Zn in serum. Additionally, serum pools were spiked with a suite of trace elements (Co, Cr, Li, Mg, Mn, Ti, and V), including copper as CuCl<sub>2</sub> at various concentrations. The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and ~~free~~ of pathogens. The Certificate of Analysis provided by SKML is available upon request.

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for serum copper range from 694 µg/L (10.92 µmol/L) to 2365 µg/L (37.22 µmol/L).

**Acceptable ranges** for serum copper are based on fixed criteria of  $\pm 15\%$ , or  $\pm 95$  µg/L below 635 µg/L. These criteria are consistent with those proposed by the OELM Network of EQAS organizers (1, 2) for trace elements in serum, and are slightly less stringent than those previously suggested for NYS ( $\pm 10\%$ ).

**Discussion.** Based on the above criteria, 93.3% of test results reported were judged as satisfactory, with one out of 18 participant laboratories (5.6%) reporting 2 or more of the 5 results outside the acceptable ranges.

**Serum Selenium**

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of Al, Cu, Se and Zn in serum. Additionally, serum pools were spiked with a suite of trace elements (Co, Cr, Li, Mg, Mn, Ti, and V), including selenium as  $\text{SeO}_2$  at various concentrations. The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and free of pathogens. The Certificate of Analysis provided by SKML is available upon request.

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for serum selenium range from 39  $\mu\text{g/L}$  (0.49  $\mu\text{mol/L}$ ) to 174  $\mu\text{g/L}$  (2.20  $\mu\text{mol/L}$ ).

**Acceptable ranges** for serum selenium are based on fixed criteria of  $\pm 20\%$ , or  $\pm 2 \mu\text{g/L}$  below 10  $\mu\text{g/L}$ . These criteria are a little less stringent than those proposed by the OELM Network of EQAS organizers ( $\pm 15\%$  or  $\pm 8 \mu\text{g/L}$  below 55  $\mu\text{g/L}$ ) (1, 2) for trace elements in serum. As performance for serum Se improves among NYS-permit laboratories, consideration will be given to adopting the OELM criteria.

**Discussion.** We have become aware of a potential interference on Se in ICP-MS when sera from bovine sources are used for PT sample pools. We are currently investigating this and will report on our findings in due course. Until that time, grading for serum Se is suspended, and unsatisfactory performances and event failures based on analysis of bovine sera will be expunged from the record. We ask that participants continue to analyze our serum pools for Se, along with other trace elements, to aid in the investigation. We are considering including human sera for comparison purposes in the next two PT events. We request participant's cooperation by analyzing these additional materials for Se, and we will shortly be circulating a questionnaire asking for more details of the analytical methods used for Se.

**Serum Zinc**

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of Al, Cu, Se and Zn in serum. Additionally, serum pools were spiked with a suite of trace elements (Co, Cr, Li, Mg, Mn, Ti, and V), including zinc as  $ZnCl_2$  at various concentrations. The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and free of pathogens. The Certificate of Analysis provided by SKML is available upon request.

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for serum zinc range from 1196  $\mu\text{g/L}$  (18.29  $\mu\text{mol/L}$ ) to 2070  $\mu\text{g/L}$  (31.66  $\mu\text{mol/L}$ ).

**Acceptable ranges** for serum zinc are based on fixed criteria of  $\pm 15\%$ , or  $\pm 15 \mu\text{g/L}$  below 100  $\mu\text{g/L}$ . These criteria are consistent with those proposed by the OELM network of EQAS organizers (1) for trace elements in serum.

**Discussion.** Based on the above criteria, 91.2% of test results reported were judged as satisfactory, with three out of 25 participant laboratories (12.0 %) reporting 2 or more of the 5 results outside the acceptable ranges.

**Additional Trace Elements Reported in Serum**

Participant laboratories reported their analytical results for any additional trace elements (other than Al, Cu, Se and Zn) that are routinely reported so that a more complete characterization can be recorded for these PT materials. Results for additional trace elements are reported here, but no target value is implied nor are any acceptable ranges provided. These data are provided solely for educational and informational purposes.

Serum materials were obtained from the Dutch EQA (External Quality Assessment) scheme SKML (Stichting Kwaliteitsbewaking Medische Laboratoria) as part of a global collaborative exercise to harmonize international measurements of Al, Cu, Se and Zn in serum. Additionally, serum pools were spiked with a suite of trace elements at various concentrations including cobalt as  $\text{CoCl}_2$ , chromium as  $\text{CrCl}_3$ , lithium as  $\text{LiCl}$ , magnesium as  $\text{MgCl}_2$ , manganese as  $\text{MnCl}_2$ , thallium as  $\text{TlNO}_3$ , and vanadium as  $\text{VOSO}_4$ . The serum has been tested and found to be negative for BSE (Bovine Spongiform Encephalopathy), and free of pathogens. The Certificate of Analysis provided by SKML is available upon request.

***ATOMIC SPECTROMETRY METHODS***

- A-1    ETAAS-Z (Electrothermal atomic absorption spectrometry with Zeeman background correction)
- A-2    ETAAS other (i.e., D<sub>2</sub>, S-H background correction)
- A-3    FAAS (Flame atomic absorption spectrometry)
- A-4    CV-AAS (Cold vapor atomic absorption spectrometry)
- A-5    HG-AAS (Hydride generation atomic absorption spectrometry)
- A-6    AFS (Atomic fluorescence spectrometry)
- A-7    Other

***INDUCTIVELY COUPLED PLASMA***

- P-1    ICP-MS (Inductively coupled plasma - mass spectrometry)
- P-2    DRC/CC-ICP-MS (ICP-MS used in the Dynamic Reaction Cell or Collision Cell mode)
- P-3    ICP-AES/OES (ICP atomic/optical emission spectrometry)
- P-4    HR-ICP-MS (High resolution ICP-MS)
- P-5    ETV-ICP-MS (Electrothermal vaporization ICP-MS)
- P-6    ID-ICP-MS (Isotope dilution ICP-MS)
- P-7    Other

***ELECTROCHEMICAL METHODS***

- E-1    ASV (Anodic stripping voltammetry without digestion)
- E-2    ASV-LeadCare® (Anodic stripping voltammetry using the ESA LeadCare® system)
- E-3    Fluoride specific electrode
- E-4    Other

***MOLECULAR FLUORIMETRY***

- F-1    EtOAc (Ethyl acetate-acetic acid extraction method for determination of erythrocyte protoporphyrin)
- F-2    Aviv hematofluorometry (for determination of EP at hematocrit 35)
- F-3    Helena ZPP (for determination of zinc protoporphyrin in µmol ZPP/mol heme)
- F-4    Other

***OTHER METHODS***

If your method is not listed in the above list, please describe it briefly.

---
