Hematology Proficiency Test Program

Statistical Summary – October 2014 (Event 14-3)

This statistical report summarizes participant data for the Hematology proficiency survey shipped 6 October 2014.

Five test samples were distributed to participants for each test category:

Routine Blood Counts (B01, B02, B03, B04, B05)

Routine Coagulation (C01, C02, C03, C04, C05)

Cell Identification (401, 402, 403, 404, 405)

Results for individual instrument and reagent systems where the number of laboratories using those systems is three or greater are provided. Mean and Standard Deviation (± 1 SD) values are calculated by a robust statistical technique that does not assume a Gaussian distribution.

NEW YORK STATE HEMATOLOGY PROFICIENCY TEST PROGRAM

October 6, 2014

Images on the Hematology and Clinical Chemistry web page: <http://www.wadsworth.org/chemheme/cellPT> were used to test all laboratories that perform manual white cell differentials. A summary of responses appear below, acceptable responses are shown in shaded areas.

Image 401

Number of Responses	Percent of Laboratories	Cell type or finding
230	65.3%	Myelocyte
96	27.3%	Promyelocyte
17	4.8%	Reactive/Atypical lymphocyte
6	1.7%	Metamyelocyte
2	0.6%	Blast Cell, not classified
1	0.3%	Normal lymphocyte

The arrowed white blood cell in Image 401 is large, the nuclear shape is oval and void of any nucleoli, the chromatin appears somewhat coarse and the cytoplasm contains secondary pink granules. The cell is best described as a myelocyte as most participants concur.

The image was captured from the peripheral blood smear of a 77 year-old male with a diagnosis of myeloproliferative dysplastic syndrome (MDS), the same case used in the November 2008 Cytohematology Proficiency Test Challenge, Slide 075 (<http://www.wadsworth.org/chemheme/heme/glass/slide075.pdf>). The expected range for myelocytes in the case of Slide 075 was 1 – 7. Other findings reported by participants included basophilic stippling and elliptocytes as observed in Image 401.

Ninety-six participants identified the arrowed cell in Image 401 as a promyelocyte. The lack of distinct nucleoli and pale blue cytoplasm identify the cell, more favorably, as a myelocyte and not a promyelocyte. There are a few granules present in the cell that could be disputed as being the darker primary granules characteristic of a promyelocyte, therefore, both myelocyte and promyelocyte were acceptable responses.

Image 402

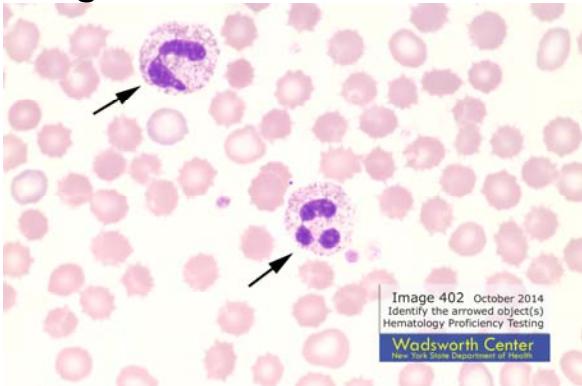

Image 402 October 2014

Hematology Proficiency Testing
Wadsworth Center
New York State Department of Health

Number of Responses	Percent of Laboratories	Cell type or finding
180	51.1%	Segmented/band neutrophil with toxic granulation
169	48.0%	Segmented neutrophil
2	0.6%	Eosinophil
1	0.3%	Neutrophil with Pelger-Hüet nucleus

The arrowed white blood cells in Image 402 are segmented neutrophils and the presence of large, dark cytoplasmic granules and vacuoles suggest the cells are “toxic” and are best described as segmented/band neutrophil with toxic granulation as 180 participants agree.

The large dark primary granules known as toxic granulation are most commonly observed in the neutrophils of those with an inflammatory condition such as sepsis, as was the case presented in Image 402. The persistence of the primary granules, lysosomes composed of enzymes, is indicative of the bone marrow's rushed maturation in response to infection.

Cells similar in appearance to those with toxic granulation are observed in a group of inherited metabolic disorders known as mucopolysaccharidoses. The group of disorders is collectively referred to as Alder-Reilly anomaly and includes Hurler's syndrome, Hunter's syndrome and polydystrophic dwarfism (Maroteaux-Lamy's syndrome). Those afflicted with the disease either lack the enzymes necessary to break down mucopolysaccharides or the enzymes malfunction and accumulate in harmful amounts. The presence of the large granules in monocytes and lymphocytes as well as neutrophils, the lack of cytoplasmic vacuoles and Döhle bodies distinguishes the Alder-Reilly granulation from that of toxic granulation.

The preferred response for the arrowed cells in Image 402, given the attributes of the cells described in paragraph one, is segmented/band neutrophil with toxic granulation. Due to lack of 80% consensus for both participant and referee laboratories, pass credit was issued.

Image 403

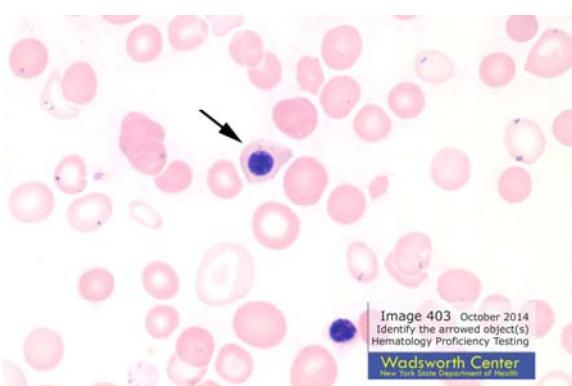

Image 403 October 2014
Identify the arrowed object(s)
Hematology Proficiency Testing
Wadsworth Center
New York State Department of Health

Number of Responses	Percent of Laboratories	Cell type or finding
352	100.0%	Nucleated red cell

The arrowed cell in Image 403 was correctly identified by all participants as a nucleated red blood cell. The image was taken from a 76 year-old female with myeloproliferative dysplastic syndrome including red blood cell dyscrasias. The one hundred white blood cell differential included more than three hundred nucleated red blood cells and numerous additional red cell morphology including target cells, macrocytes, schistocytes, echinocytes, elliptocytes, Howell-Jolly bodies, and Pappenheimer bodies. Many of the red blood cell findings mentioned above are seen in Image 403.

Image 404

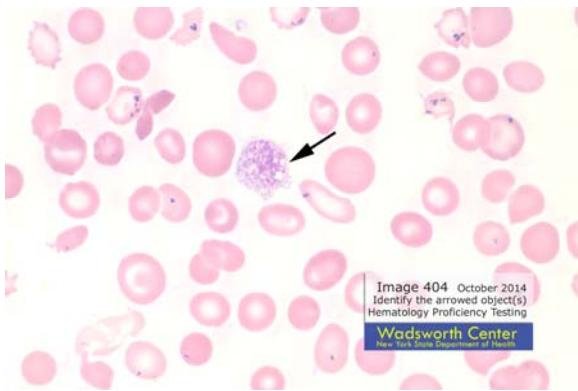

Image 404 October 2014
Identify the arrowed object(s)
Hematology Proficiency Testing

Wadsworth Center
New York State Department of Health

Number of Responses	Percent of Laboratories	Cell type or finding
342	97.2%	Giant platelet
4	1.1%	Smudge cell/Basket cell
2	0.6%	Schuffner's granule(s)
2	0.6%	Platelet
1	0.3%	Basophilic stippling
1	0.3%	Parasite

Image 404 was obtained from the same case as Image 403, myeloproliferative dysplastic syndrome including red blood cell dyscrasia. The arrowed image, a giant platelet, was correctly reported by 97.2% of participants. A platelet is considered giant when it is equal to or greater than the size of a normal red blood cell. The presence of giant platelets would not be an unexpected finding in this case. The numerous nucleated red blood cells and the red blood cell inclusions, Holly-Jolly and Pappenheimer bodies, are suggestive of a hyperactive bone marrow where immature cells are prematurely released.

Image 405

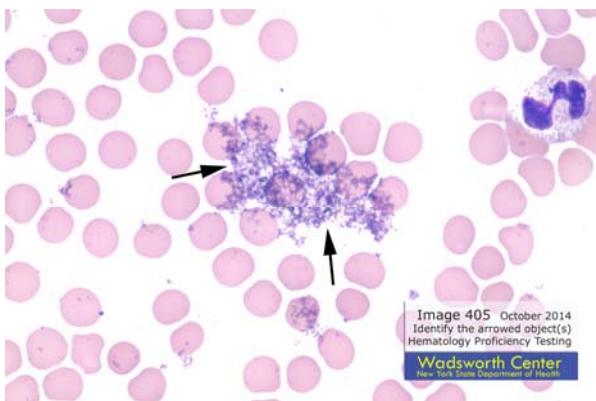

Image 405 October 2014
Identify the arrowed object(s)
Hematology Proficiency Testing

Wadsworth Center
New York State Department of Health

Number of Responses	Percent of Laboratories	Cell type or finding
352	100.0%	Stain precipitate

The bluish color and nondescript shape of the arrowed object in Image 405 was correctly identified by all participants as stain precipitate.
