**Trace Elements in Whole Blood  
Event #2, 2011**

Dear Laboratory Director:

Results from the second proficiency test (PT) event in 2011 for Trace Elements in Whole Blood have been tabulated and summarized. Target values for Arsenic, Cadmium, Mercury and Lead in whole blood have been established along with acceptable ranges. Results are graded using element-specific criteria as indicated in each narrative section. A laboratory with an unacceptable significant analytical bias relative to the target value will be expected to investigate the source of the error. A confidential three-digit code number assigned by the PT program identifies participant laboratories. The data for blood lead were previously reported in the Blood Lead PT Report issued June 21st, 2011, and are reproduced here for completeness.

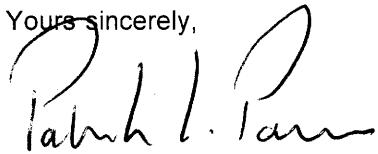

**PT Materials**

Test materials for the first event were prepared from caprine (goat) whole blood obtained from animals dosed with lead acetate to create physiologically bound lead (Pb). A total of five blood pools were supplemented with different arsenic species [inorganic As<sup>3+</sup> and As<sup>5+</sup>, monomethylarsonic acid (MMA), dimethylarsinic acid (DMA), and arsenobetaine], cadmium (as Cd<sup>2+</sup>) and mercury as both inorganic (Hg<sup>2+</sup>) and as methylmercury (CH<sub>3</sub>Hg<sup>+</sup>) species. In addition to As, Cd, Pb and Hg, blood pools were supplemented with the trace elements manganese (Mn), thallium (Tl), tin (Sn) and cobalt (Co).

**The next PT event for trace elements in whole blood is scheduled to be mailed Wednesday, September 21st, 2011. Please inform our laboratory staff at (518) 474-4484 if the test materials have not arrived within five days of the scheduled mail out date. The deadline for reporting results is Wednesday, October 12th, 2011.**

Thank you for your participation in this event.

Yours sincerely,

Patrick J. Parsons, Ph.D.  
Chief  
Laboratory of Inorganic and Nuclear Chemistry

Mary Frances Verostek, Ph.D.  
Assistant Section Head  
PT Program for Blood Lead /EP/Trace Elements

**New York State Department of Health**  
**Event #2, 2011**

---

**Whole Blood Arsenic**

Test materials for arsenic were prepared from caprine (goat) whole blood preserved with K<sub>2</sub>EDTA anticoagulant. A total of five pools were supplemented with different arsenic species: inorganic As<sup>3+</sup> and As<sup>5+</sup>, monomethylarsonic acid (MMA), dimethylarsinic acid (DMA), and arsenobetaine.

<b>Sample</b>	<b>Arsenic species added</b>
BE11-06	As <sup>3+</sup> , DMA and arsenobetaine
BE11-07	As <sup>3+</sup> and MMA
BE11-08	As <sup>3+</sup> , MMA, DMA and arsenobetaine
BE11-09	As <sup>3+</sup>
BE11-10	As <sup>3+</sup> , MMA and DMA

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood arsenic range from 17.7 µg/L (0.24 µmol/L) to 58.6 µg/L (0.78 µmol/L).

**Acceptable range:** The acceptable range for arsenic is set at ±6 µg/L or ±20%, whichever is greater. Thus, it is fixed at ± 6 µg/L for concentrations below 30 µg/L.

**Discussion:** Based upon the above criteria, 95.6% of test results reported were judged as satisfactory, with one of the 18 laboratories (5.6%) reporting 2 or more of the 5 results outside the acceptable ranges.

---

**Whole Blood Cadmium**

Test materials for cadmium were prepared from caprine (goat) whole blood preserved with K<sub>2</sub>EDTA anticoagulant. A total of five blood pools were supplemented with different amounts of cadmium (as Cd<sup>2+</sup>).

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood cadmium range from 2.2 µg/L (20 nmol/L) to 17.8 µg/L (158 nmol/L).

**Acceptable ranges** are based on the OSHA criteria of ±15%, or ±1 µg/L around the target value, whichever is greater. So, the range is fixed at ±1 µg/L for concentrations below 6.6 µg/L, where above 6.6 µg/L, it is ±15%.

**Discussion:** Based upon the above criteria, 95.6% of the results reported by all participants were satisfactory, with two of the 27 laboratories (7.4%) reporting 2 or more of the 5 results outside the acceptable ranges.

**Event #2, 2011**

---

**Whole Blood Mercury**

Test materials for mercury were prepared from caprine (goat) whole blood preserved with K<sub>2</sub>EDTA anticoagulant. A total of five pools were supplemented with different amounts of mercury as both inorganic ( $Hg^{2+}$ ) and organometallic (as methylmercury,  $CH_3Hg^+$ ) species.

**The Target Value** assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood mercury range from 2.0  $\mu\text{g/L}$  (10 nmol/L) to 44.2  $\mu\text{g/L}$  (220 nmol/L).

**Acceptable ranges** were fixed at  $\pm 30\%$ , or  $\pm 3 \mu\text{g/L}$  around the target value, whichever is greater. That is, the range is fixed at  $\pm 3 \mu\text{g/L}$  for concentrations below 10  $\mu\text{g/L}$ , while above 10  $\mu\text{g/L}$ , it is  $\pm 30\%$ .

**Discussion:** Based on the above criteria, 100% of results reported by all participants were satisfactory, with none of the 27 laboratories reporting 2 or more of the 5 results outside the acceptable ranges. Note: Some methods based on cold vapor generation (e.g., CV-AAS) may only detect inorganic Hg thus leading to a low bias compared to methods based on total Hg measurement (e.g., ICP-MS, and CV-AAS combined with on-line microwave digestion). See Barbosa et al. (2004) JAAS (1) for more details on total Hg in blood using CV-AAS.

**Whole Blood Lead**

Test materials for lead were prepared from caprine (goat) whole blood obtained from animals dosed with lead acetate to create physiologically-bound Pb. Whole blood was collected into collection bags containing K<sub>2</sub>EDTA anticoagulant.

**Target values** were established as the mean of 21 measurements performed by 19 reference laboratories using ICP-MS, ETAAS and ASV methods. Values range from 5 µg/dL to 34 µg/dL. Among the reference group, imprecision (SD) varied from 0.4 - 1.6 µg/dL, increasing with Pb concentration.

**Acceptable ranges** are based on the CLIA '88 criteria (Federal Register Volume 57, Number 40, §§ 493.2 and 493.937, February 28, 1992). The criteria are set at  $\pm 10\%$  or  $\pm 4$  µg/dL, whichever is greater.

**Discussion** Based on the CLIA '88 criteria, 96.7% of results reported by all participants were judged as satisfactory, with 4 out of 95 participant laboratories (4.2%) reporting 2 or more of the 5 results outside the acceptable ranges.

## **Additional Trace Elements Reported in Whole Blood**

Participant laboratories reported their analytical results for any additional trace elements (other than As, Cd, Hg and Pb) that are routinely reported so that a more complete characterization can be recorded for these proficiency test materials. Results for additional trace elements are reported here, but no target value is implied nor are any acceptable ranges provided. These data are provided solely for educational and informational purposes.

In addition to As, Cd, Pb and Hg, the whole blood pools were supplemented with additional trace elements as indicated below.

### **Additional Elements**

**METHOD NOTES**

---

**ATOMIC SPECTROMETRY METHODS**

- A-1    ETAAS-Z (Electrothermal atomic absorption spectrometry with Zeeman background correction)
- A-2    ETAAS other (i.e., D<sub>2</sub>, S-H background correction)
- A-3    FAAS (Flame atomic absorption spectrometry)
- A-4    CV-AAS (Cold vapor atomic absorption spectrometry)
- A-5    HG-AAS (Hydride generation atomic absorption spectrometry)
- A-6    AFS (Atomic fluorescence spectrometry)
- A-7    Other

**INDUCTIVELY COUPLED PLASMA**

- P-1    ICP-MS (Inductively coupled plasma - mass spectrometry)
- P-2    DRC/CC-ICP-MS (ICP-MS used in the Dynamic Reaction Cell or Collision Cell mode)
- P-3    ICP-AES/OES (ICP atomic/optical emission spectrometry)
- P-4    HR-ICP-MS (High resolution ICP-MS)
- P-5    ETV-ICP-MS (Electrothermal vaporization ICP-MS)
- P-6    ID-ICP-MS (Isotope dilution ICP-MS)
- P-7    Other

**ELECTROCHEMICAL METHODS**

- E-1    ASV (Anodic stripping voltammetry without digestion)
- E-2    ASV-LeadCare® (Anodic stripping voltammetry using the ESA LeadCare® system)
- E-3    Fluoride specific electrode
- E-4    Other

**MOLECULAR FLUORIMETRY**

- F-1    EtOAc (Ethyl acetate-acetic acid extraction method for determination of erythrocyte protoporphyrin)
- F-2    Aviv hematofluorometry (for determination of EP at hematocrit 35)
- F-3    Helena ZPP (for determination of zinc protoporphyrin in µmol ZPP/mol heme)
- F-4    Other

**OTHER METHODS**

If your method is not listed in the above list, please describe it briefly.

---
