

To: Laboratory Directors and Laboratory Staff
From: Robert Rej, Ph.D.
Date: March 6, 2012
Subject: Results of the February 6, 2012 Hematology Proficiency Test

Enclosed are results from the hematology proficiency testing survey shipped February 6, 2012. Five samples were distributed for each test category:

Routine Blood Counts (B56, B57, B58, B59, B60)

Routine Coagulation (C56, C57, C58, C59, C60 - APTT, PT/INR and Fibrinogen assays)

Cell Identification (356, 357, 358, 359, 360)

Evaluation of Proficiency Test Results:

Note: This report includes evaluation of the International Normalized Ratio (INR).

Outlined below is a description of the process used to evaluate your laboratory's proficiency test results. A summary of your laboratory's performance for the three most recent surveys is also included with this report.

Target Value: When possible, targets utilized are derived from all-participant mean values calculated by a robust statistical technique. In some cases, however, it is recognized that reagent, and/or instrument specific targets may be required and "peer group" specific targets are used where appropriate. An asterisk placed adjacent to the manufacturer name or instrument name indicates that a peer group was used in establishing targets and acceptable ranges.

Not Gradable: Results for graded analytes for a few laboratories using unique instrument, reagent, or instrument/reagent combinations were considered "not gradable". For these laboratories pass credit (100%) has been issued. Since the laboratory is unable to participate in the NYS hematology proficiency test event as a graded participant, it is the responsibility of the laboratory to establish alternate means to verify the accuracy and precision of the test system for any ungraded analyte(s).

Acceptable Range: Represents limits established using criteria specified by CLIA '88 regulations, allowing for rounding to appropriate significant digits. Results falling within this range are scored as 100%. Any result exceeding these limits is considered unsatisfactory and receives a score of 0%.

Range Plots: The range plots graphically represent the relative distance of all results reported by your laboratory from the target value. Any result exceeding the high or low limit by >20% of the acceptable range is indicated by an asterisk (*).

Analyte Score: Scores for both individual samples and overall analyte performance are provided. Laboratories must achieve an overall analyte score >80% in order to meet performance criteria for that analyte.

Statistical Summary: Also enclosed is a statistical summary of participant data for the survey specimens. Mean and standard deviation (1 SD) values shown on the attached sheets are calculated by a robust statistical technique that does not assume a Gaussian distribution. Please note that standard deviation values are not used to determine acceptable ranges; CLIA '88 regulations established percentage limits for cellular and coagulation analytes.

Cellular Hematology (CBC): Results for individual instruments, where the number of laboratories using those systems is three or greater, are provided.

Coagulation: Results for individual instrument and reagent systems as well as instrument/reagent combinations, where the number of laboratories using those systems is three or greater, are provided.

The use of brand and/or trade names in this report does not constitute an endorsement of the products on the part of the Wadsworth Center or the New York State Department of Health.

So that this analysis can be as complete as possible, please review all future testings carefully and properly identify reagent and instrument systems used.

If you have any questions regarding these reports or wish to obtain an additional copy, please contact the Hematology Laboratory at (518) 474-9878. You may also contact us by E-mail: heme@wadsworth.org

World Wide Web: Results from this proficiency test event and selected previous proficiency test events are available on the Hematology and Clinical Chemistry web page at: <http://www.wadsworth.org/chemheme>

NEW YORK STATE HEMATOLOGY PROFICIENCY TESTING PROGRAM

February 6, 2012

Images on the Hematology and Clinical Chemistry web page: <http://www.wadsworth.org/chemheme/cellIPT> were used to test all laboratories that perform manual white cell differentials. A summary of responses appear below, acceptable responses are shown in shaded areas.

Image 356

The arrowed cell in Image 356 is large and the nuclear chromatin shows areas of slight clumping and faint nucleoli. Primary granules are present. These characteristics support the identification of this cell as a promyelocyte as 71.8% of participants reported.

Image 356 was taken from the case of Refractory Anemia that transformed to Acute Myelogenous Leukemia (AML) used in the November 2008 Cytohematology proficiency test challenge, Slide 073.

<http://www.wadsworth.org/chemheme/heme/glass/slide073.pdf>.

Blast cells and promyelocytes were reported present in this case; participant median for myeloblast/promyelocyte was five.

Due to lack of 80% participant consensus, pass credit was issued.

Number of Responses	Percent of Laboratories	Cell type or finding
265	71.8%	Promyelocyte
75	20.3%	Blast cell, not classified
12	3.3%	Myelocyte
8	2.2%	Myeloblast
3	0.8%	Metamyelocyte
3	0.8%	Reactive/Atypical lymphocyte
2	0.5%	Lymphoblast
1	0.3%	Lymphoma/Sézary cell

Image 357

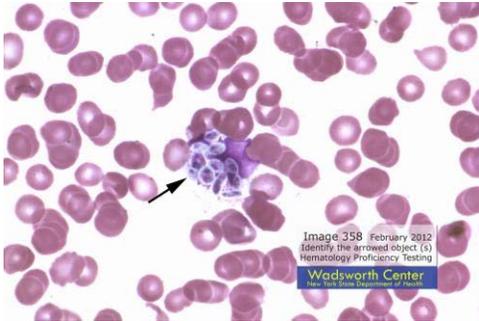

The arrowed segmented neutrophil is surrounded by platelets and was correctly reported by 369 participants as platelet satellitosis. The image was taken from a thirteen year-old female who presented with eosinophilia .

Platelet satellitosis or satellitism is a phenomenon that was first reported in 1963 as a possible cause of thrombocytopenia. It is observed most commonly in peripheral blood collected in ethylene diaminetetracetic acid (EDTA). In the presence of EDTA, IgG coats platelets and the antibody-coated platelets attach to, most commonly, neutrophils and very rarely to monocytes. The platelets that are adhered to the cell are not counted by automated cell counters causing a false low platelet count. When a low platelet count is verified by review of the peripheral smear the examiner should consider platelet satellitosis in addition to platelet clumping.

Number of Responses	Percent of Laboratories	Cell type or finding
369	100.0%	Platelet satellitosis

Image 358

The arrowed object in Image 358 might, at quick glance, appear to include multiple “lobes”. After closer examination, however, it is evident the “lobes” are delineated and possess a distinct lighter area (halo) around the periphery. A clear halo is formed around the yeast/fungi organism after it is engulfed by either a neutrophil or a monocyte. The arrowed object in Image 358 was correctly identified by 86.2% of participants as Yeast-Fungus.

Number of Responses	Percent of Laboratories	Cell type or finding
318	86.2%	Yeast-Fungus
36	9.8%	Parasite
11	3.0%	Platelet clump(s)
1	0.3%	Smudge cell/Basket cell
1	0.3%	Platelet
1	0.3%	Giant platelet
1	0.3%	Stain precipitate

Image 359

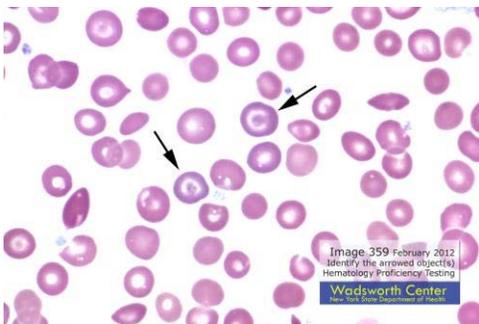

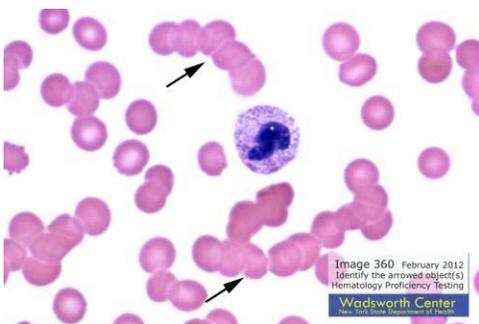

Image 359 was taken from the case of sickle cell anemia used in the November 2009 Cytohematology proficiency test challenge, Slide 076. <http://www.wadsworth.org/chemheme/heme/glass/slide076.pdf>. The arrowed cells in Image 359 were easily recognized by 368 participants as target cells. There was a high prevalence of target cells in this case. Ninety-five percent of participants reported their presence as a significant finding.

The most common causes of target cell formation include artifacts of air-drying (high humidity or slow drying), decreased cell volume (iron deficiency, thalassemia and hemoglobinopathies) and increased surface membranes (liver disease, asplenic).

Number of Responses	Percent of Laboratories	Cell type or finding
368	99.7%	Target cell (codocyte)
1	0.3%	Stomatocyte

Image 360

The arrowed objects are red blood cells in rouleaux formation as correctly identified by all participants. Rouleaux formation of red cells is due to increased amounts of plasma proteins and is observed in chronic liver disease, malignant lymphoma, chronic infections, inflammatory conditions and as in this case of multiple myeloma.

Number of Responses	Percent of Laboratories	Cell type or finding
369	100.0%	Rouleaux
