Trace Elements in Whole Blood Event #2, 2013

Dear Laboratory Director:

Results from the second proficiency test (PT) event in 2013 for Trace Elements in Whole Blood have been tabulated and summarized. Target values for Arsenic, Cadmium, Mercury and Lead in whole blood have been established along with acceptable ranges. Results are graded using element-specific criteria as indicated in each narrative section. A laboratory with an unacceptable significant analytical bias relative to the target value will be expected to investigate the source of the error. A confidential three-digit code number assigned by the PT program identifies participant laboratories. The data for blood lead were previously reported in the Blood Lead PT Report issued June 13th, 2013, and are reproduced here for completeness.

PT Materials

Test materials for the second event were prepared from caprine (goat) whole blood obtained from animals dosed with lead acetate to create physiologically bound lead (Pb). A total of five blood pools were supplemented with arsenic (as inorganic As³⁺), cadmium (as Cd²⁺) and mercury as both inorganic (Hg²⁺) and organic (ethylmercury (CH₃CH₂Hg⁺) and methylmercury (CH₃Hg⁺)) species. In addition to As, Cd, Pb and Hg, blood pools were supplemented with the trace elements manganese (Mn), thallium (Tl), tin (Sn), titanium (Ti), nickel (Ni), cobalt (Co), chromium (Cr), tungsten (W) and vanadium (V).

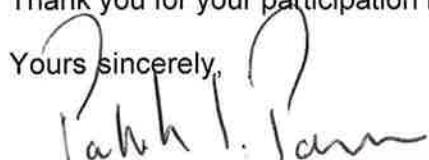

Additional Elements to Become Graded for Performance Assessment

PT results for select trace elements, including Co, Cr and Mn, will be graded as part the next PT event, although the data will be used for "Educational Purposes" only to inform laboratory participants of where improved practices may be necessary. Laboratories that test and report these, and other, trace elements on patient specimens should continue to report results obtained for whole blood PT samples.

The next PT event for trace elements in whole blood is scheduled to be mailed Wednesday, September 11th, 2013. Please inform our laboratory staff at (518) 474-4484 if the test materials have not arrived within five days of the scheduled mail out date. The deadline for reporting results is Wednesday, October 2nd, 2013.

Thank you for your participation in this event.

Yours sincerely,

Patrick J. Parsons, Ph.D.
Chief, Laboratory of Inorganic and Nuclear Chemistry
Deputy Director, Division of Environmental Health

Mary Frances Verostek, Ph.D.
Assistant Section Head
PT Program for Blood Lead /Trace Elements

New York State Department of Health
Event #2, 2013

Whole Blood Arsenic

Test materials for arsenic were prepared from caprine (goat) whole blood preserved with K₂EDTA anticoagulant. A total of five pools were supplemented with arsenic as inorganic As³⁺.

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood arsenic range from 8.5 µg/L (0.11 µmol/L) to 60.6 µg/L (0.81 µmol/L).

Acceptable range: The acceptable range for arsenic is set at ± 6 µg/L or $\pm 20\%$, whichever is greater. Thus, it is fixed at ± 6 µg/L for concentrations below 30 µg/L.

Discussion: Based upon the above criteria, 96.8% of test results reported were judged as satisfactory, with none of the 19 laboratories reporting 2 or more of the 5 results outside the acceptable ranges.

New York State Department of Health
Event #2, 2013

Whole Blood Cadmium

Test materials for cadmium were prepared from caprine (goat) whole blood preserved with K₂EDTA anticoagulant. A total of five blood pools were supplemented with different amounts of cadmium (as Cd²⁺).

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood cadmium range from 2.2 µg/L (20 nmol/L) to 17.0 µg/L (151 nmol/L).

Acceptable ranges are based on the OSHA criteria of ±15%, or ±1 µg/L around the target value, whichever is greater. So, the range is fixed at ±1 µg/L for concentrations below 6.6 µg/L, where above 6.6 µg/L, it is ±15%.

Discussion: Based upon the above criteria, 95.4% of the results reported by all participants were satisfactory, with two of the 26 laboratories (7.7%) reporting 2 or more of the 5 results outside the acceptable ranges.

Event #2, 2013

Whole Blood Mercury

Test materials for mercury were prepared from caprine (goat) whole blood preserved with K₂EDTA anticoagulant. A total of five pools were supplemented with different amounts of mercury as both inorganic (Hg²⁺) and organometallic (as both ethylmercury, CH₃CH₂Hg⁺, and methylmercury, CH₃Hg⁺) species.

Sample	Mercury species added
BE13-06	Hg ²⁺ , CH ₃ Hg ⁺ , and CH ₃ CH ₂ Hg ⁺
BE13-07	Hg ²⁺ , CH ₃ Hg ⁺
BE13-08	Hg ²⁺ and CH ₃ Hg ⁺ , and CH ₃ CH ₂ Hg ⁺
BE13-09	Hg ²⁺ and CH ₃ Hg ⁺ , and CH ₃ CH ₂ Hg ⁺
BE13-10	Hg ²⁺

The Target Value assigned for each PT material is the robust mean of the results reported by all participants in this event. The robust statistics were obtained utilizing algorithms based on those presented in **ISO 13528:2005E Statistical methods for use in proficiency testing by interlaboratory comparisons**. Values for whole blood mercury range from 1.7 µg/L (8 nmol/L) to 33.1 µg/L (165 nmol/L).

Acceptable ranges were fixed at ±30%, or ±3 µg/L around the target value, whichever is greater. That is, the range is fixed at ±3 µg/L for concentrations below 10 µg/L, while above 10 µg/L, it is ±30%.

Discussion: Based on the above criteria, 93.3% of results reported by all participants were satisfactory, with three of the 27 laboratories (11.1%) reporting 2 or more of the 5 results outside the acceptable ranges.

New York State Department of Health
Event #2, 2013

Whole Blood Lead

Test materials for lead were prepared from caprine (goat) whole blood obtained from animals dosed with lead acetate to create physiologically-bound Pb. Whole blood was collected into collection bags containing K₂EDTA anticoagulant.

Target values were established as the mean of 21 measurements performed by 19 reference laboratories using ICP-MS, ETAAS and ASV methods. Values range from 4 µg/dL to 28 µg/dL. Among the reference group, imprecision (SD) varied from 0.7 - 1.3 µg/dL, increasing with Pb concentration.

Acceptable ranges are based on the CLIA '88 criteria (Federal Register Volume 57, Number 40, §§ 493.2 and 493.937, February 28, 1992). The criteria are set at ±10% or ±4 µg/dL, whichever is greater.

Discussion Based on the CLIA '88 criteria, 99.3% of results reported by all participants were judged as satisfactory, with none of 90 participant laboratories reporting 2 or more of the 5 results outside the acceptable ranges.

**New York State Department of Health
Event #2, 2013**

Additional Trace Elements Reported in Whole Blood

Participant laboratories reported their analytical results for any additional trace elements (other than As, Cd, Hg and Pb) that are routinely reported so that a more complete characterization can be recorded for these proficiency test materials. Results for additional trace elements are reported here, but no target value is implied nor are any acceptable ranges provided. These data are provided solely for educational and informational purposes.

In addition to As, Cd, Pb and Hg, the whole blood pools were supplemented with the following additional trace elements as indicated below

Additional Elements

Co, Cr, Mn, Sn, Tl, Ti, V, W, Ni

**New York State Department of Health
Blood Lead Test Results, 2013 Event #2
METHOD NOTES**

ATOMIC SPECTROMETRY METHODS

- A-1 ETAAS-Z (Electrothermal atomic absorption spectrometry with Zeeman background correction)
- A-2 ETAAS other (i.e., D₂, S-H background correction)
- A-3 FAAS (Flame atomic absorption spectrometry)
- A-4 CV-AAS (Cold vapor atomic absorption spectrometry)
- A-5 HG-AAS (Hydride generation atomic absorption spectrometry)
- A-6 AFS (Atomic fluorescence spectrometry)
- A-7 Other

INDUCTIVELY COUPLED PLASMA

- P-1 ICP-MS (Inductively coupled plasma - mass spectrometry)
- P-2 DRC/CC-ICP-MS (ICP-MS used in the Dynamic Reaction Cell or Collision Cell mode)
- P-3 ICP-AES/OES (ICP atomic/optical emission spectrometry)
- P-4 HR-ICP-MS (High resolution ICP-MS)
- P-5 ETV-ICP-MS (Electrothermal vaporization ICP-MS)
- P-6 ID-ICP-MS (Isotope dilution ICP-MS)
- P-7 Other

ELECTROCHEMICAL METHODS

- E-1 ASV (Anodic stripping voltammetry without digestion)
- E-2 ASV-LeadCare® (Anodic stripping voltammetry using the ESA LeadCare® system)
- E-3 Fluoride specific electrode
- E-4 Other

MOLECULAR FLUORIMETRY

- F-1 EtOAc (Ethyl acetate-acetic acid extraction method for determination of erythrocyte protoporphyrin)
- F-2 Aviv hematofluorometry (for determination of EP at hematocrit 35)
- F-3 Helena ZPP (for determination of zinc protoporphyrin in µmol ZPP/mol heme)
- F-4 Other

OTHER METHODS

If your method is not listed in the above list, please describe it briefly.
